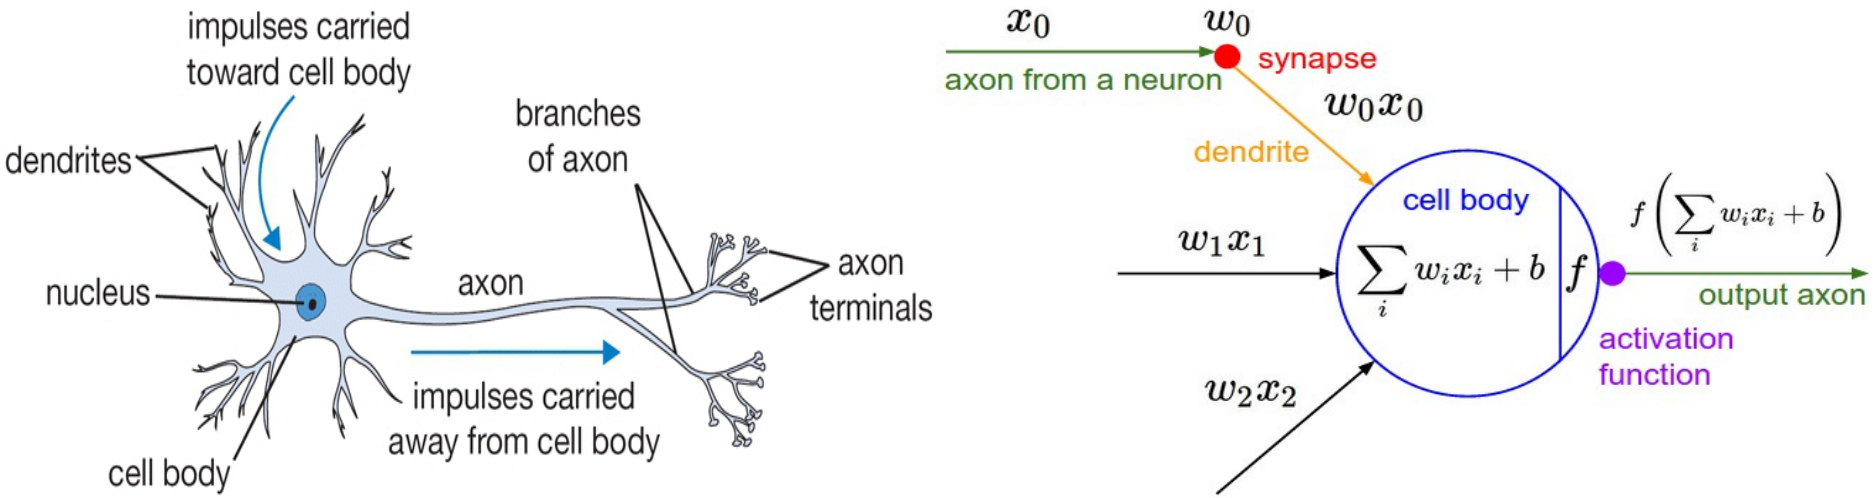
Background and Motivation - Neural Networks

Primary motivation: Neural Networks mathematically simulate biological functionalities of the human brain



(a) biological model

(b) mathematical representation

Figure: neuronal model and computational abstraction

Background and Motivation - Principle

Neural Networks generally contain:

- an n-dimensional input
- one or many layers of interconnected neurons
- an output-layer

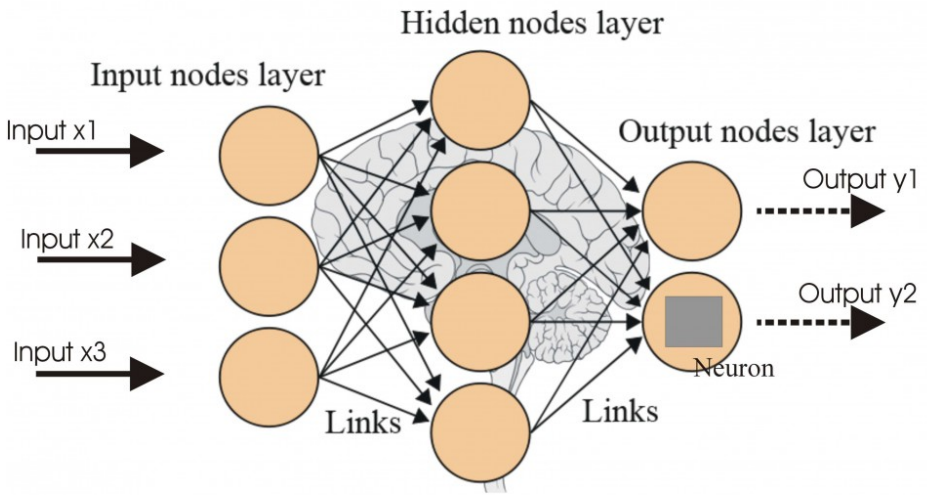


Figure: Basic concept of a Neural Network

Background and Motivation - Convolutional Neural Networks

Convolutional Neural Networks (CNNs) are a subtype of Neural Networks:

- all neurons in a layer are identical
- layers are interconnected through a kernel function
- different types of layers are used

Background and Motivation - Convolutional Neural Networks

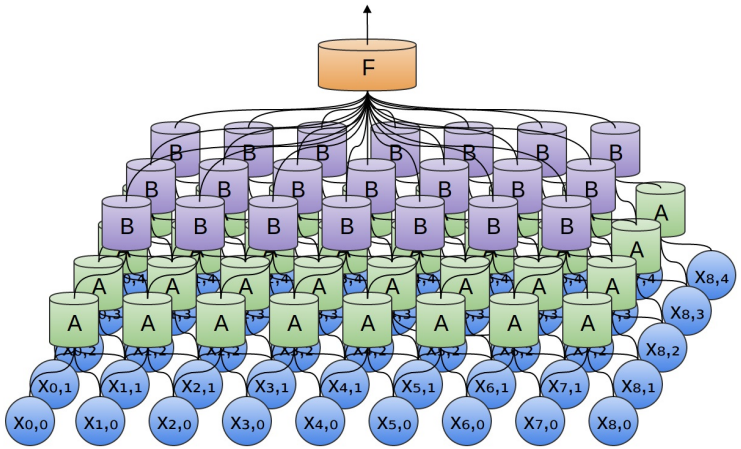

Figure: 2-dimensional CNN

1. Using identical copies of the same neuron allows for complex models with few parameters
2. Convolutional layers are not fully connected; each neurons is locally connected with a subsection of the previous layer

Background and Motivation - Application

Visual Object Recognition

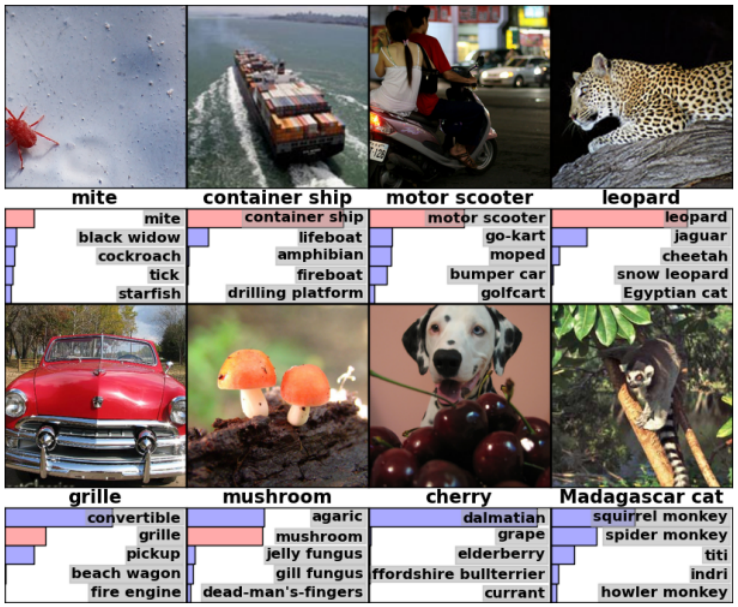

Figure: ImageNet Classification with Deep Convolutional Neural Networks

ImageNet by Krizhevsky et al (2012) classified 1.2 million high-resolution images in the ImageNet LSVRC-2010 into 1000 different classes. It achieves error rates of 37.5% for the top result and 17.0% for the top-5 results

Background and Motivation - Application

Text Classification

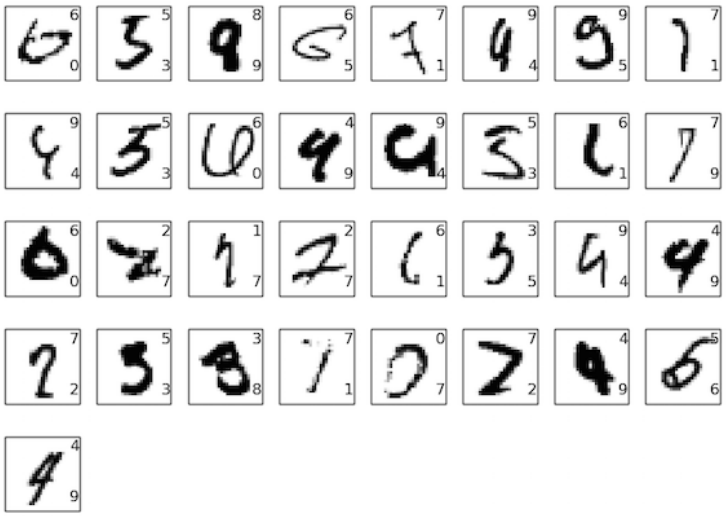

Figure: Excerpt of mnist

Components

hier Bild eines CNNs unseres Typs mit Komponenten

1. Neuron
2. Kernel-Function
3. Sigmoid function
4. softmax

Propagation - Forward Propagation

Forward propagation is the process of computing the output of a network for a given input

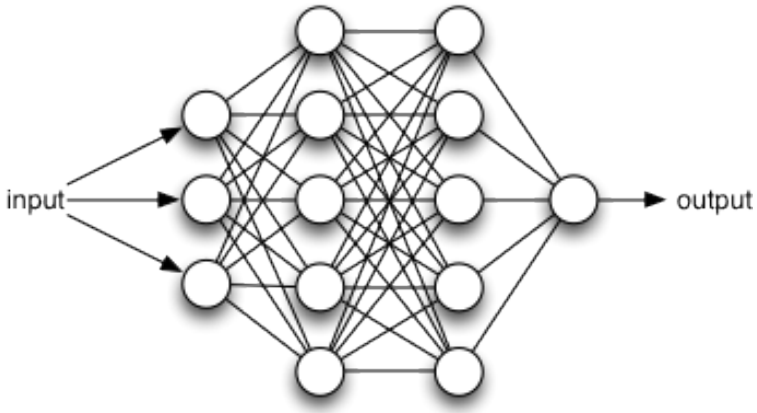

Figure: Forward propagation in a complex neural network
